                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   CC This sequence represents a Leu/Lys diastereomer peptide of the CC invention. The peptides of the invention have: (a) cytolytic activity on the peptides of the invention have: (a) cytolytic activity on the cells (pathogenic cells (pathogenic and malignant cells not naturally present in CC concentration significantly higher than that at which they lyse concentration significantly higher than that at which they lyse concentration significantly higher than that at which they lyse concentration significantly higher than that at which they lyse concentrations (caused by bacteria, fungi, protozoa, mycoplasma or viruses) or cancer, in human and veterinary medicine. Also, they can be used as concernatives for food, cosmetics and agricultural produce, or as concernative for food, cosmetics and agricultural produce, or as concernative for protocolated structures) means that the peptides concernative for particular structures means that the peptides concernative descriptions concernations concluded by the concernation of alpha-helical structures) means that the peptides concernative for protocolated by the concernation of alpha-helical structures of the concernation of alpha those that include D-aa will have concernated are sistance to protocolytic degradation. Non-haemolytic, concernation of alpha-helical structures are pecific spectrum of these random copolymers of pardaxin, each has a specific spectrum of these random copolymers induce total lysis of bacterial cell walls, xx resistance to them is unlikely to develop.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Matches
      New non-haemolytic cytolytic agent useful in treating cancer or infections - is a peptide comprising a moiety which disrupts the continuity of an alpha-helical structure
                                                                                        WPI; 1998-594464/50
                                                                                                                                                                   (YEDA ) YEDA RES & DEV CO LTD

The CC specification describes a non-haemolytic, cytolytic agent, which is a CC peptide, a complex of bundled peptides, a mixture of peptides or a random CC peptide copplymer. The agent has a sclective cytolytic activity on CC pathogenic cells. The agent has a sclective greater than 1, comprises L-amino CC peptide which has a net positive charge greater than 1, comprises L-amino acid residues and comprises an alpha-helix CC comprises L-amino acid residues and comprises an alpha-helix CC comprises L-amino acid residues and presidues, has a net CC comprises L-amino acid residues and presidues, has a net CC is not found in nature. The cytolytic agents may be used for treatment of concluding bacterial, fungal, viral, mycoplasma and protozoan infections. CC They may be used in both human and veterinary medicine. They may also be cosmetic and food industries, as preservatives, e.g., in the cosmetic and food industries, as pesticides (e.g. fungicides or CC cosmetic and food industries, as pesticides (e.g. fungicides or CC cosmetic and food industries, as pesticides (e.g. fungicides or CC cosmetic and food industries, as pesticides (e.g. fungicides or CC cosmetic and food industries, as pesticides (e.g. fungicides or CC cosmetic and food industries, as pesticides (e.g. fungicides or CC cosmetic and food industries, as pesticides (e.g. fungicides or CC cosmetic and food industries, as pesticides (e.g. fungicides or CC cosmetic and food industries, as pesticides (e.g. fungicides or CC cosmetic and food industries as pesticides (e.g. fungicides or CC cosmetic and food industries as pesticides (e.g. fungicides or CC cosmetic and food industries as pesticides (e.g. fungicides or CC cosmetic and food industries as pesticides (e.g. fungicides or CC cosmetic and food industries as pesticides (e.g. fungicides or CC cosmetic and food industries as pesticides (e.g. fungicides or CC cosmetic and cosmetic and food industries as pesticides (e.g. fungicides or CC

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     activities. DNAs, vectors and host cells from the present invention can be used for producing pharmaceutical compositions. The compositions are useful for treating cancer, asthma, thrombosis, or autoimmune diseases. The use of an Fc domain (rather than a Fab domain) can provide a longer half-life or incorporate functions such as Fc receptor binding, protein A binding, complement fixation, and possibly placental transfer. AAA6944 to AAA69526 and AAB16955 to AAB18003 represent nucleotide and amino acid sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention describes composition of matter (I) comprising FC domain, pharmacologically active peptides, and linkers. Where (I) (X1)a-F1-(X2)b, where: F1 = an FC domain; X1 and X2 = are each independently selected from -(L1)c-P1, -(L1)c-P1-(L2)d-P2, -(L1)e-P3, or -(L1)c-P1-(L2)d-P2-(L3)e-P3-(L4)f-P4 where P1, P2, P3, and P4 = are each independently sequences of

CC This peptide is used in a novel process for the synthesis of a KL-4 CC pulmonary surfactant protein. The process comprises: (a) reacting a CC 3-amino acid peptide residue of formula H-Lys(2)-Leu-Leu-OH with a 5-CC amino acid peptide residue Boc-Leu-Leu-OH with a 5-CC amino acid peptide residue Boc-Leu-Lys(2)-Leu-Leu-OH (II) to yield CC an 8-amino acid peptide residue, which is successively reacted with the CC 5-amino acid peptide to form an 18-amino acid peptide of formula H-Leu-Leu-CC Lys(2)-Leu4)3Lys(2)-OBzl (IIIa); (b) reacting the 18 amino acid CC peptide with a 3-residue amino acid peptide of formula H-Leu-Leu-CC Lys(2)-OBzl (X) to form the protected 21-amino acid KL-4 protein; and CC reaction with a suitable acid to form the final KL-4 protein. The CC methods can be used for the preparation of the polypeptide component of the synthetic pulmonary surfactant KL-4 which can be used in the CC treatment of respiratory distress syndrome. The saponification process CC can provide for the deprotection of a peptide ester protected carboxyl Group with reduced racemisation. The liquid phase peptide processes CC provide advantages in solubility and control over unwanted by-products.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Preparation of KL-4 pulmonary surfactant - using liquid phase peptide synthesis procedures by coupling appropriate peptide fragments

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ρy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This peptide is used in a novel process for the synthesis of a KL-4 CC 3-amino acid peptide residue of formula H-Lys(Z)-Leu-Leu-OH with a 5-CC amino acid peptide residue Boc-Leu-Lys(Z)-Leu-Leu-OH with a 5-CC an 8-amino acid peptide residue, which is successively reacted with the CC H-Leu-Leu(Lys(Z)-Leu-Leu-OH (II) to yield CC 5-amino acid peptide to form an 18-amino acid peptide of formula CC H-Leu-Leu(Lys(Z)-Leu-Leu-OH (II) to yield CC H-Leu-Leu(Lys(Z)-Leu-Leu-OH (III)) to yield CC H-Leu-Leu(Lys(Z)-Leu-Leu-OH (III)) to yield CC H-Leu-Leu(Lys(Z)-DBZ1 (IIIa); (b) reacting the 18 amino acid CC H-Leu-Leu-OH (III) to yield CC H-Leu-Leu-OH (III) to yield IIIa); (b) reacting the 18 amino acid CC Lys(Z)-OBZ1 (X) to form the protected 21-amino acid KL-4 protein; and CC reaction with a suitable acid to form the final KL-4 protein. The CC methods can be used for the preparation of the polypeptide component of the synthetic pulmonary surfactant KL-4 which can be used in the CC treatment of respiratory distress syndrome. The saponification process group with reduced racemisation of a peptide ester protected carboxyl provide advantages in solubility and control over unwanted by-products.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Matches

                                                                                                                                                                                                                                                                                                                                                    В
                                                                                                                                                                                                                                                                                                                                                                            γ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This sequence represents a Leu/Lys diastereomer peptide of the CC invention. The peptides of the invention have: (a) cytolytic activity on the body, but (b) no haemolytic activity, or such activity only at a concentration significantly higher than that at which they lyse concentration significantly higher than that at which they lyse concentration significantly higher than that at which they lyse concentration significantly higher than that at which they lyse concentrations (caused by bacteria, fungi, protozoa, mycoplasma or viruses) created the concentratives for food, cosmetics and agricultural produce, or as concentratives for food, cosmetics and agricultural produce, or as concentratives for food, cosmetics and agricultural produce, or as concentrative for food, cosmetics and agricultural produce, or as concentrative for fany toxic effects, and those that include D-ta will have concentrated the protocolymers of pardaxin, each has a specific spectrum of these random copolymers of pardaxin, each has a specific apportant of these random copolymers induce total lysis of bacterial cell walls, xx
                                                                                                                                                                                                                                                                                                                                                                                                   Query Match

                                                                                                                                                                                                                                                                                                                                                                 This peptide is used in a novel process for the synthesis of a KL-4 CC pulmonary surfactant protein. The process comprises: (a) reacting a CC 3-amino acid peptide residue of formula H-Lys(Z)-Leu-Leu-OH with a 5-CC an 8-amino acid peptide residue Boc-Leu-Lys(Z)-Leu-Leu-OH (II) to yield CC an 8-amino acid peptide to form an 18-amino acid peptide of formula CC H-Leu-Leu(Lys(Z)-Leu4)3Iys(Z)-OBZ1 (IIIa); (b) reacting the 18 amino acid compensation acid peptide of formula CC Lys(Z)-OBZ1 (XI) to form the protected 21-amino acid KL-4 protein; and CC reaction with a suitable acid to form the 21-amino acid KL-4 protein by CC compensation of the polypeptide component of treatment of respiratory distress syndrome. The saponification process can provide for the deprotection of a peptide ester protected carboxyl provide advantages in solubility and control over unwanted by products.

The methods can be used for the preparation of the polypeptide component of the synthetic pulmonary surfactant KL-4 which can be used in the treatment of respiratory distress syndrome. The saponification process can provide for the deprotection of a peptide ester protected carboxyl group with reduced racemisation. The liquid phase peptide processes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      pulmonary surfactant protein. The process comprises: (a) reacting a 3-amino acid peptide residue of formula H-Lys(2)-Leu-Leu-OH with a 5-amino acid peptide residue Boo-Leu-Leu-Hys(2)-Leu-Leu-OH (II) to yield an 8-amino acid peptide residue, which is successively reacted with the 5-amino acid peptide to form an 18-amino acid peptide of formula

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The peptide is an example of a highly generic peptide comprising 10 60 amino acid residues, including a sequence having alternating hydrophobic and hydrophilic amino acid residue regions. When the polypeptide is mixed with a phospholipid a synthetic pulmonary surfactant is formed which has greater surfactant activity than the phospholipid alone. The surfactant is used for the treatment of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Polypeptide(s) comprising alternating hydrophobic and hydrophilic residue regions - are useful as pulmonary surfactants for treating respiratory distress syndrome
                                                                                                                                                                                                                                                                                              Liposomal pulmonary surfactant composition; preparation; respiratory distress syndrome; premature infant; premature monolayer formation; alveolar air-water interface.
                                                                                                                                                                                                                                                                                                                                                                                                                  AAW32109 standard; peptide;

pulmonary surfactant of the invention. It is a mimic of human

Surfactant protein SP-18. Synthetic pulmonary surfactants comprise

one or more phospholipids and a peptide having alternating

charged and uncharged amino acids (see AAW82728-82 and AAW88193-97).

The synthetic pulmonary surfactant is used in a claimed method for

pulmonary lavage of a mammal. Lavage is used to treat respiratory

contents, pulmonary inflammation or infection, acute hypoxaemia,

persistent foetal circulation, congenitad diaphramatic hernia,

persistent foetal circulation, inhalation of hot or noxious vapour,

persistent foetal circulations. The lavage solution removes

inflammatory mediators and preserves or restores pulmonary
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Вb

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           15-MAR-1999
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Lys(2)-OBzl (X) to form the protected 21-amino acid KL-4 protein; and (C) removing the protecting group of the 21-amino acid KL-4 protein by reaction with a suitable acid to form the final KL-4 protein. The methods can be used for the preparation of the polypeptide component of the synthetic pulmonary surfactant KL-4 which can be used in the treatment of respiratory distress syndrome. The saponification process can provide for the deprotection of a peptide ester protected carboxyl group with reduced racemisation. The liquid phase peptide processes provide advantages in solubility and control over unwanted by-products.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Néurochem. 48:16-21(1987).

-I. FUNCTION: Catalyzes the reversible synthesis of acetylcholine
-(ACh) from acetyl CoA and choline at cholinergic synapses.
-I. CATALYTIC ACTIVITY: Acetyl-CoA + Choline = CoA + O-acetylcholine.
-I. SIMILARITY: BELONGS TO THE CARNITINE/CHOLINE ACETYLTRANSFERASE

Thuman choline acetyltransferase gene.";

RL Neurosci. Lett. 132:191-194(1991).

C. -i- FUNCTION: Catalyzes the reversible synthesis of acetylcholine (Ach) from acetyl CoA and choline at cholinergic synapses.

C. -i- CATALYTIC ACTIVITY: Acetyl-COA+ choline = COA+ O-acetylcholine.

CC -i- ALTERNATIVE PRODUCTS: 3 isoforms; M/83 kDa (shown here), S/74 kDa

CC -i- ALTERNATIVE PRODUCTS: 3 isoforms; M/83 kDa (shown here), S/74 kDa

CC -i- DISEASE: Defects in CHAT are a cause of familial infantile

CC myasthenic gravis type 2 (FIMG2) (also known as CMS-EA). FIMG2

CC myasthenic gravis type 2 (FIMG2) (also known as CMS-EA). FIMG2

CC negative tests for anti-AChR antibodies, and abrupt episodic

CC crises with increased weakness, bulbar paralysis, and apnea

CC -i- SIMILARITY: BELONGS TO THE CARNITINE/CHOLINE ACETYLTRANSFERASE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      use by non-profit modified and this st
